Powerful Strategies For Agriculture + Feed Operations

America's rapidly rising energy costs are choking the competitiveness of our nation's agriculture and grain and feed industries. Solential Energy believes implementing a proactive, renewable energy-based strategy is the best way to rein in costs and return sanity, predictability, and control to your operation.

"Our grain operations are critical to animal health and pork production. Any interruption in power or loss of heat can alter the chemistry of our feed, which in turn impacts the growth of our animals and profitability of the business. Adding solar to our energy equation allows us to continue to optimize our grain processing and get the best feed to our animals without the stress of higher energy costs."

—Gerry Daignault, VP, Support Operations

THE MASCHHOFFS: PUTTING THEIR SOLAR STRATEGY TO WORK

In the first four months of 2022, The Maschhoffs, one of the nation's largest pork producers, saw their energy costs double at their primary feed mill in Griggsville, Illinois. The financial impact was unsustainable.

Solential is now installing a 3.06 MW solar array with 6,800 panels on 11 acres adjacent to the mill. When the array is commissioned in October 2022, The Maschhoffs will see their first-year energy costs drop by \$320,000. **WIN!**
